# PDE II: Problem Set III-IV

Youngduck Choi \*

#### Abstract

This work contains solutions for the problem set II.

## Question 1-1.

The want to prove the Hardy inequality.

$$\left(\int_{\mathbb{R}^d} \frac{|f(x)|^2}{|x|^2} dx\right)^{1/2} \leqslant \frac{2}{d-2} \left(\int_{\mathbb{R}^d} |\nabla f|^2 dx\right)^{1/2} \quad \text{if } d \geqslant 3$$
a) Does it follow from the Sobolev embedding theorem
b) Check that the scaling is satisfied (consider  $f_{\lambda}$ ...)
c) Can it hold for  $d=1,2$ ,  $f\in\mathcal{B}^{los}$ ?
d) Prove this identity for  $f\in\mathcal{B}^{los}$  by using the identity  $(x\cdot\nabla)|x|^{-2} = -2|x|^{-2} \left(x\cdot\nabla = \sum x^i\partial_i\right)$  to integrate by farts in  $\int_{\mathbb{R}^d} \frac{|f(x)|^2}{|x|^2}$ , followed by Cauchy - Schwarz
e) Extend this result to any  $f\in H^1(\mathbb{R}^d)$ ,  $d \geqslant 3$ 

## Solution.

- (a) It does not follow from sobolev embedding, as  $||\cdot||_{H^1(\mathbb{R}^d)}$  is not equivalent to  $||\nabla\cdot||_{L^2(\mathbb{R}_d)}$ .
- (b) Let f satisfy the inequality. Then, by a change of variables,

$$\left(\int_{\mathbb{R}^d} \frac{|f(\lambda x)|^2}{|x|^2} dx\right)^{\frac{1}{2}} = |\lambda|^{\frac{2-d}{2}} \left(\int_{\mathbb{R}^d} \frac{|f(x)|^2}{|x|^2} dx\right)^{\frac{1}{2}}$$

$$\leq \frac{2}{d-2} |\lambda|^{\frac{2-d}{2}} \left(\int_{\mathbb{R}} |\nabla f(x)|^2 dx\right)^{\frac{1}{2}}$$

$$= \frac{2}{d-2} \left(\int_{\mathbb{R}} |\nabla f(\lambda x)|^2 dx\right)^{\frac{1}{2}}$$

<sup>\*</sup>Department of Mathematics, Courant Institute of Mathematical Sciences, yc1104@nyu.edu; If you find an error and want to share with me, you can reach me via email.

- (c) For d = 1, the proof in part (d) would work. For d = 2, let f = 1 on B(0,1) and  $f \in C_0^{\infty}$ . Then, RHS is finite, but the LHS is infinite, so the inequality does not for for d = 2.
- (d) By integrating by parts,

$$\int_{\mathbb{R}^d} \frac{|f(x)|^2}{|x|^2} dx = -\frac{1}{2} \sum_{i=1}^d \int_{\mathbb{R}^d} |f(x)|^2 x^i \partial_i |x|^{-2} dx 
= \frac{1}{2} \sum_{i=1}^d \int_{\mathbb{R}^d} \partial_i (|f(x)|^2 x_i) |x|^{-2} dx 
= \frac{1}{2} \int_{\mathbb{R}^d} \frac{2|f(x)|}{|x|^2} x \cdot \nabla f(x) dx + \frac{d}{2} \int_{\mathbb{R}^d} \frac{|f(x)|^2}{|x|^2} dx$$

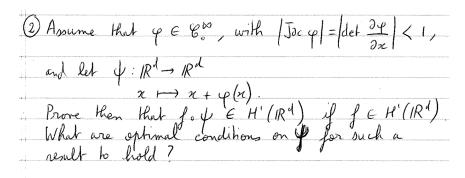

and hence, by Cauchy-Schwartz,

$$\int_{\mathbb{R}^d} \frac{|f(x)|^2}{|x|^2} dx \leq \frac{2}{d-2} \int_{\mathbb{R}^d} \frac{|f(x)|}{|x|^2} x \cdot \nabla f dx \\
\leq \frac{2}{d-2} \left( \int_{\mathbb{R}^d} |\nabla f(x)|^2 dx \right)^{\frac{1}{2}} \left( \int_{\mathbb{R}^d} \frac{|f(x)|^2}{|x|^2} dx \right)^{\frac{1}{2}}.$$

Therefore, dividing by the second term on the RHS, we see that the inequality holds for the case considered.

(e) Fix  $f \in H^1(\mathbb{R}^d)$ . By density of  $C_0^{\infty}(\mathbb{R}^d)$  in  $H^1(\mathbb{R}^d)$ , we can choose a sequence in  $C_0^{\infty}$ ,  $\{f_n\}$  that converges to f in  $H^1(\mathbb{R}^d)$ . Then, we can choose a subsequence of  $\{f_n\}$  denoted by  $\{g_n\}$  such that  $g_n$  converges to f a.e. and  $\nabla g_n$  converges to f a.e. Now, by DCT, we see that the inequality can be extended.

## Question 1-2.

Solution. As  $|\det \frac{\partial \phi}{\partial x}| < 1$ ,

$$||\partial_i (f \circ \psi)||_{L^2}^2 = \int_{\mathbb{R}^d} |\triangle f|^2 + |\triangle f \cdot \frac{\partial \phi}{\partial x_i}|^2 dx \le C||\triangle f||_{L^2}^2.$$

Let  $y = \Psi(x)$ , and inf  $|\det \frac{\partial \Psi}{\partial x}| > 0$ . Then, by inverse function theorem, we have h such that  $\sup |\det h(y)| < \infty$ , and  $h(y) = (D\Psi)^{-1}(y)$ . Then,

$$\int_{\mathbb{R}^d} |f \circ \Psi(x)|^2 dx \le \sup|\det h(y)| ||f||_{L^2}^2 < \infty.$$

Now, consider  $d \geq 3$ ,  $f(x) = |x|^{\alpha} X(x)$ ,  $X(x) \in C_0^{\infty}(\mathbb{R}^d)$ , X = 1 on B(0,1),  $\alpha > 1 - \frac{d}{2}$ . We from hw1 that  $f \in H^1(\mathbb{R}^d)$ . Now, set  $\Psi(x) = |x|^2 x$  if  $|x| < \frac{1}{2}$  and x if |x| > 1. Then, we see  $f \circ \Psi \not\in H^1(\mathbb{R}^d)$  is equivalent  $\alpha \geq \frac{1}{3} - \frac{d}{6}$ . As  $\alpha$  can be chosen to be in  $(1 - \frac{d}{2}, \frac{1}{3} - \frac{d}{6}]$ , we see that the condition is optimal.

## Question 1-3.

(3) Prove that the Hs (IR4) norm is equivalent to the following norm:
$$\left(\int_{\mathbb{R}^d} |u(n)|^2 dx\right)^{1/2} + \left(\int_{\mathbb{R}^d} \frac{|u(n+y) - u(y)|^2}{|y|^{d+2s}} dx dy\right)^{1/2}$$
if  $s \in (0,1)$  and  $d \ge 2$ . [Argue in Fourier space]

## Solution.

We compute

$$\begin{split} \int_{\mathbb{R}^d} \frac{|e^{iy\xi}-1|^2}{|y|^{d+2s}} dy & \leq & C\left(\int_{|y|<\frac{1}{|\xi|}} \frac{|y|^2|\xi|^2}{|y|^{d+2s}} dy + \int_{|y|>\frac{1}{|\xi|}} \frac{1}{|y|^{d+2s}} dy\right) \\ & = & C\left(|\xi|^2 \int_0^{\frac{1}{|\xi|}} r^{-d-2s+2} r^{d-1} dr + \int_{\frac{1}{|\xi|}}^{\infty} r^{-d-2s+d-1} dr\right) \\ & = & C\left(|\xi|^2 r^{-2s+2}|_0^{\frac{1}{|\xi|}} + r^{2s}|_{\frac{1}{|\xi|}}^{\infty}\right) \sim <\xi >^{2s} \,. \end{split}$$

Similarly,

$$\int_{\mathbb{R}^d} \frac{|e^{iy\xi}-1|^2}{|y|^{d+2s}} dy \ge C|\xi|^{2s} \sim <\xi>^{2s}.$$

Since, by Fubini,

$$\int \int \frac{|u(x+y) - u(x)|^2}{|y|^{d+2s}} dx dy = \int \int |e^{iy\xi} - 1|^2 |\hat{u}(\xi)|^2 d\xi \frac{1}{|y|^{d+2s}} dy 
= \int \int |e^{iy\xi} - 1|^2 \frac{1}{|y|^{d+2s}} dy |\hat{u}(\xi)|^2 d\xi,$$

and the established asymtotics, we see the norm equivalence.

## Question 1-4.

(4) We want to prove the Rellich Kondrakov theorem.

Let K be a compact set of IRd.

a) For s>0, ε>0, s=ε>0, show that the embedding H'(Rd) ⊆ H<sup>s-ε</sup>(Rd) is not compact (ie: there are bounded sequences in H''(Rd) which do not admit any convergent subsequence in H<sup>s-ε</sup>).

b) If 0 < s < d/z, p = 2d, show that the embedding H''(K) ⊆ L<sup>1</sup>(Rd) is not compact.

c) Prove that H''(K) ⊆ ⊆ H<sup>s-ε</sup>(Rd) (compact.

[Hint: show that it suffices to find embedding) a subsequence fm s.t. fm → f uniformly on B(0, N) for all N, and then use Anzela - Ascoli].

d) Prove that H''(Td) ⊆ ⊆ H<sup>s-ε</sup>(Td)

[Som Angue in Fourier space; the definition of H''(Td) is identical to that of H''(Rd)

replacing the continuous frequencies E by discrete frequencies k, and ∫Rd E ]

# Solution.

(a) Let  $B_n = B(0, \frac{1}{n})$ , for  $n \in \mathbb{N}$ ,  $\Omega_1 = B_1$ , and  $\Omega_n = B_n \setminus B_{n-1}$  for  $n \geq 2$ . Furthermore, for each  $n \in \mathbb{N}$ , let

$$c_n = \left(\int_{\Omega_n} \langle \xi \rangle^{2s-2\epsilon} d\xi \right)^{-\frac{1}{2}} \text{ and } \hat{f}_n = c_n 1_{\Omega_n}.$$

Then,

$$||f_n||_{H^{s-\epsilon}(\mathbb{R})} = \left( \int_{\mathbb{R}^d} (\langle \xi \rangle^{s-\epsilon} \hat{f}(\xi))^2 d\xi \right)^{\frac{1}{2}} = \left( \int_{\Omega_n} c_n^2 \langle \xi \rangle^{2s-2\epsilon} d\xi \right)^{\frac{1}{2}} = 1$$

for any  $n \in \mathbb{N}$ , and

$$\langle f_n, f_m \rangle_{H^{s-\epsilon}(\mathbb{R}^d)} = \int_{\mathbb{R}_d} \langle \xi \rangle^{2s-2\epsilon} \hat{f}_n(\xi) \hat{f}_m(\xi) d\xi = 0$$
 (1)

for any  $n,m\in\mathbb{N}$  with  $n\neq m,$  where (1) follows from the fact that  $\hat{f}_n$  and  $\hat{f}_m$  have disjoint

supports, if  $n \neq m$ . Therefore,

$$||f_n - f_m||_{H^{s-\epsilon}(\mathbb{R}^d)}^2 = \langle f_n - f_m, f_n - f_m \rangle$$

$$= ||f_n||_{H^{s-\epsilon}(\mathbb{R}^d)}^2 + ||f_m||_{H^{s-\epsilon}(\mathbb{R}^d)}^2 - 2 \langle f_n, f_m \rangle = 2$$

for any  $n, m \in \mathbb{N}$ , with  $n \neq m$ , so  $\{f_n\}$  does not have a convergent subsequence in  $H^{s-\epsilon}(\mathbb{R}^d)$ . Furthermore,

$$||f_n||_{H^s(\mathbb{R}^d)} = \int_{\Omega_n} c_n^2 < \xi >^{2s} d\xi = c_n^2 \int_{\Omega_n} c_n^2 < \xi >^{2s} d\xi \le 2^{\epsilon} c_n^2 \int_{\Omega_N} < \xi >^{2s-2\epsilon} d\xi = 2^{\epsilon}$$
 (2)

for any  $n \in \mathbb{N}$ , where (2) holds by  $<\xi> \le 2$  for any  $\xi \in B(0,1)$ . Therefore, the embedding is not compact.

(b) Let  $f \in H^s(K)$  such that  $||f||_{H^s} > 0$ , and set  $f_n = n^{\frac{d}{p}} f(n \cdot)$  for any  $n \in \mathbb{N}$ . Then,  $||f_n||_{L^p} = ||f||_{L^p}$  for all n, and  $f_n \to 0$  almost everywhere. We see that  $\{f_n\}$  does not have any convergence subsequence, as if some  $\{f_{n_k}\}$  converges to some g in  $L^p$ , then there is a further subsequence that convergence to g, so g = 0, which is a contradiction, as  $||g||_{L^p} = ||f||_{L^p} \ge ||f||_{H^s(K)} > 0$ , by continuity of the norm. Now,

$$||f_n||_{H^s(K)}^2 = \int \langle \xi \rangle^{2s} n^{2d(\frac{1}{p}-1)} |f(\frac{\xi}{n})|^2 d\xi$$

$$\leq n^{2d(\frac{1}{p}-\frac{1}{2})+2s} \int (1+|\xi|^2)^s |\hat{f}(\xi)|^2 d\xi$$

$$= ||f||_{H_s(K)}^2$$

for all n, so we see that the inclusion is not compact.

(c) Let  $\{f_n\}$  be a sequence in  $H^s(K)$  such that there exists a constant C such that  $||f_n||_{H^s(K)} \leq C$  for all  $n \in \mathbb{N}$ . Then,

$$||\hat{f}_n||_L^{\infty} \leq (2\pi)^{\frac{d}{2}} \sqrt{m(K)} \sup_n ||f_n||_{H^s(K)} < \infty$$

for all n. Furthermore, for any  $\xi_1, \xi_2 \in \mathbb{R}^d$ , and  $n \in \mathbb{N}$ ,

$$|\hat{f}_n(\xi_1) - \hat{f}_n(\xi_2)| = C |\int_K (e^{-i\xi_1 \cdot x} - e^{-i\xi_2 \cdot x}) f_n(x) dx|$$

$$\leq C \int_K |f_n| |\xi_1 - \xi_2| |x| dx \leq C |\xi_1 - \xi_2|.$$

Therefore,  $\{\hat{f}_n\}$  is uniformly bounded on a compact set, and equicontinuous. Now, upto diagonal extraction, we have a subsequence denoted as  $\{\hat{f}_n\}$ , which converges uniformly on B(0,k) for all k. Let g be defined by a.e. convergence of  $\{\hat{f}_n\}$ . Fix  $\delta > 0$ . Choose N large enough such that

$$\frac{1}{(1+N^2)^\epsilon} \leq \frac{\delta}{\delta \sup_n ||f_n||^2_{H_s}} \quad \text{and} \quad \int <\xi>^{2s-2\epsilon} |g|^2 X_{B(0,N)^c} <\delta.$$

and hence

$$||f_n||_{H^{s-\epsilon}}^2 \le \int \langle \xi \rangle^{2s-2\epsilon} X_{B(0,N)} |\hat{f}_n - \hat{f}|^2 + 2 \int \langle \xi \rangle^{2s-2\epsilon} X_{B(0,N)^c} |\hat{f}_n|^2 |g|^2 \le C\delta.$$

So the embedding is compact.

(d) Observe that

$$\sum \langle \xi \rangle^{2s-2\epsilon} |\hat{f}(\xi) - \hat{f}_n(\xi)|^2 \leq \sum_{|\xi| > N} + 2\sum_{|\xi| > N} \langle \xi \rangle^{2s-2\epsilon} |\hat{f}(\xi)|^2 + 2\sum_{|\xi| > N} \langle \xi \rangle^{2s} |\hat{f}_n(\xi)|^2 \frac{1}{(1+N^2)^{\epsilon}}$$

for all n. Therefore, it's again enough to choose for fixed  $\delta > 0$ , large enough N such that

$$\frac{\sup_{n} ||f_n||_{H_s}^2}{(1+N^2)^{\epsilon}} < \frac{\delta}{8} \text{ and } \sum_{|\xi| > N} <\xi >^{2s-2\epsilon} |\hat{f}(\xi)|^2 < \frac{\delta}{8}.$$

This can be done in the analogous way with part c, by employing Weistrauss theorem and diagonal extraction.  $\Box$
